Index	9

pykit3 is a collection of toolkit in python3.

CHAPTER 1

Documentation for the Code

pk3hunum convert numbers(or numbers in *dict* or *list*) to human readable format in string.

```
>>> hunum(103425)
'101.0K'
>>> hunum({ 'total': 10240, 'progress': [1, 1024*2.1, 1024*3.2], })
{'total': '10K', 'progress': ['1', '2.10K', '3.20K']}
>>> parsenum('5.2K')
5324.8
>>> parsenum('10%')
0.1
```

pk3hunum.value_to_unit
map of int to unit, e.g.: $1024 \rightarrow "K"$, $1024^2 \rightarrow "M"$.

Usage:

```
>>> value_to_unit[1024**2]
'M'

>>> unit_to_value['K']
1024
```

Type dict

pk3hunum.unit_to_value
reverse map of *value_to_unit*.

Type dict

1.1 Functions

pk3hunum.hunum(*data*, *unit=None*, *include=None*, *exclude=None*)

hunum convert number or dict/list of number to string in a format easy to read for human.

Parameters

- **data** – could be a primitive type: *int* or *float*, or a non-primitive type object *list* or *dict*.
 - For primitive type like *int*, it converts it to string.
 - For non-primitive type like *dict*, it traverse recursively over all of its fields and convert them to string.
- **unit** (*int*) – specifies the unit of the number in the result string. It could be one of: *1024* (K), *1024²* (M) ... *1024⁸* (Y).
If it is *None*, a proper unit will be chosen to output the shortest string. For example, for *102400* it chooses *K*. For *10240000* it chooses *M*.
- **include** (*bool*) – specifies to convert only a subset of the keys of a *dict data*. It could be a *list*, *tuple* or *set* of keys.
 - It has no effect on a primitive *data*.
 - It is not passed to sub *dict* or *list*.
- **exclude** (*bool*) – specifies **NOT** to convert some of the keys of a *dict data*. It could be a *list*, *tuple* or *set* of keys.
 - It has no effect on a primitive *data*.
 - It is not passed to sub *dict* or *list*.

Returns

int/*dict*/*list*.

- For a primitive type data, it returns a string representing the number.
- For a *dict* or *list*, it makes a duplicate of *data* and convert its number fields. It leaves the original *data* intact.

`pk3hunum.parsenum(data, safe=None)`

Parse humanized number string like *10.5K* to *int* or *float*. It also parses percentage number to *float*.

Parameters

- **data** (*str*) – number string.
Valid units are: *k*, *m*, *g*, *t*, *p*, *e*, *z* and *y*. Suffix *b* and *i* will be ignored. For example: *10.1K*, *10.1k*, *10.1Kb* and *10.1Ki* are all the same.
For percentage number, valid unit is *%*. For example: *10.1%*.
- **safe** – if *safe* is *True* and data is not a valid number string, it silently returns the original *data*, instead of raising an *ValueError*.
By default it is *False*.

Returns

int/*float*.

`pk3hunum.parseint(data, safe=None)`

Same as *parsenum* but it always casts result to a *int* number.

CHAPTER 2
